INTRODUCTION

Substructure damage prevention is important to everybody.

Damage to underground utility installations in Ventura County by excavating equipment results in untold thousands of wasted dollars, lost time, and interrupted services every year. While not as spectacular as a broken water main or gas fire, other less conspicuous damage can be just as hazardous to life and costly in lost time, wasted dollars, and interrupted public services.

A ruptured telephone cable might isolate an entire community from fire and police protection, or ambulance service, or a broken gas main could result in a serious explosion as well as interruption of vital services. Industry rapidly comes to a standstill when its water or power service is suddenly cut off. As serious as all this can be, hundreds of instances of damage to substructures occur each year because greater care is not used to safeguard these installations when persons dig or do underground construction work.

Underground facilities of all kinds are being expanded to keep pace with the rapid growth of industry and population in Ventura County. From this accelerated activity in underground work, the available space under the streets is becoming more crowded every month. This means that greater caution must be taken to prevent damage to existing substructures every time underground work is done.

In addition to the usual network of public utility underground installations, water gas, telephone, power, sewer, and so forth, Ventura County is traversed by many miles of petroleum pipe lines. Since these pipe lines all carry flammable fluids under pressure, excavators should take every precaution when working in the vicinity of such substructures.

Some damaged facilities can be repaired with a minimum of service interruption if they are discovered immediately. Of greater concern are those cases of damage which are not discovered until later. A broken protective covering on a pipe that is not repaired at once may later develop leaks from corrosion. A damaged sheath of a telephone cable might go unnoticed until the first rain soaks into the ground and puts hundreds of lines out of service.

All contractors, utility companies, and public agencies who build or maintain facilities under the streets are responsible to the public and to each other for maintaining uninterrupted service. Because this responsibility is so vital to all and damage to underground plant is of such magnitude, continuing efforts must be made to find solutions to the problem.

It is hoped that widespread distribution and use of this booklet will assist those concerned with underground construction in minimizing damage to substructures as well as the hazards which may imperil the safety of workmen and the public.

FIELD PRACTICE

Southern California municipal and utility agencies, as well as the construction industry, are earnestly invited by the Ventura County Utilities Coordinating Committee to adopt and participate in the following recommended standard field practices, which were designed to aid in preventing damage to substructures.

Prior to Field Operations:

As an excavator, you should consult the "substructure" maps maintained by most cities, utilities, and the County on which an attempt is made to show installations in the street. These are sources from which you can make a quick check on many substructures. However, these records may not be completely accurate. If you suspect the presence of any installation regardless of any other information, you should contact the probable owner for accurate data.

Many different owners of substructures are found in Ventura County and their locating and marking services to you will vary from one another in some respects due to their varying size, resources, and the physical nature of their installations. At your request, the owners will give locations of their substructures or will send copies of their maps, and in many cases will locate and mark their facilities in the field within the area of your work. These services are free of charge. Make your request for maps or field marking at least one week in advance of the start of your construction work.

Field marking to indicate the approximate location of owner's facilities should be made as follows:

In paved areas the symbol indicating the location, size, and type of installation should be painted on the pavement surface. Each type of owner will use a different symbol and color to identify their installations.

The following symbols and colors are recommended for general use:

D	- Storm Drain	(Co. Name)	- Oil
FA	- Fire Alarm	P	- Power
G	- Gas	R	- Railway
L	- Street Lighting	S	- Sewer
Tel	- Telephone	T	- Traffic Signal
W	- Water	WU	- Western Union

The letters should be approximately four inches in height and underscored with a line indicating the general direction and location of the utility.

The National Color Code for subsurface facilities is as follows:

Blue	-	Water
Orange	-	Communication lines or cables, including but not limited to telephone, telegraph, fire signals, Cable TV, civil defense and electronic controls.
Green	-	Storm and sanitary sewers, including force mains and other non-hazardous material.
Red	-	Electric power lines and conduits.
Yellow	-	Gas, oil petroleum and other hazardous liquid or gaseous materials.

In areas where there is no paving, a stake with the symbol of the owner shown thereon should be driven in the earth above the utility or at designated offsets.

Field markings of substructures will be done from records or through the use of a radio frequency pipe locator. In either case, the locations as marked may not be exact. Therefore, the indicated location should be considered as approximate only.

Care should be taken to protect and maintain substructure location markers to avoid the needless cost and waste of time required to locate and mark. However, it is important that the utility agency be requested to re-establish obliterated markers. Proceeding without such marking almost invariably results in substructure damage.

Make arrangements for a meeting between your representative and the substructure owner's representative to discuss your starting location and date, direction in which the work will proceed, the anticipated rate of progress, and other pertinent information. Exchange a list of emergency telephone numbers between yourself and the owner.

During Construction Operations:

When power excavating, grading, or mechanical boring equipment approaches the location of any buried line that crosses or extends into the area of operation, the actual location of the indicated line should be determined, preferably by hand excavation.

Protect substructure coatings. Some agencies and companies have considerable investments in substructure coatings to prevent corrosion. If these coatings are damaged and not repaired, rapid corrosion of the pipeline may later result at the point of the coating break. Protective coatings usually consist of asphaltic compounds, cement-mortar mixtures, and sometimes sand surrounding the pipe. Since it is often difficult to expose or trench alongside a coated pipeline without causing some minor damage to the coating or without encountering some loss of the sand backfill, it is requested that the utility owner be notified in every instance when this protection is damaged. Repairs should always be made by the substructure owner or under his supervision. Normally, there is no charge for repairs under these circumstances.

Support all existing substructures. Substructure owners do not generally establish the methods to be taken for providing protection for their facilities which are either adjacent to or exposed by an excavation, but do rightfully expect the construction forces to provide adequate shoring or support for the substructure under all circumstances. Information pertaining to the type and kind of substructure is available on request from the owner. All shoring members supporting exposed or adjacent substructures should be left in place until backfill and compaction operations are completed. When the backfill is compacted by flooding, supports should not be removed until 12 hours after all settlement has taken place. When permitted in the backfill, rock, earth and rock, broken pavement, or other hard substances should not be dropped directly on, or placed adjacent to, exposed substructures. Carefully place the backfill on each side of the substructure until the level of the fill rises above it. When this is not practicable, plant or otherwise cover the substructure to divert the falling hard material to prevent damage.

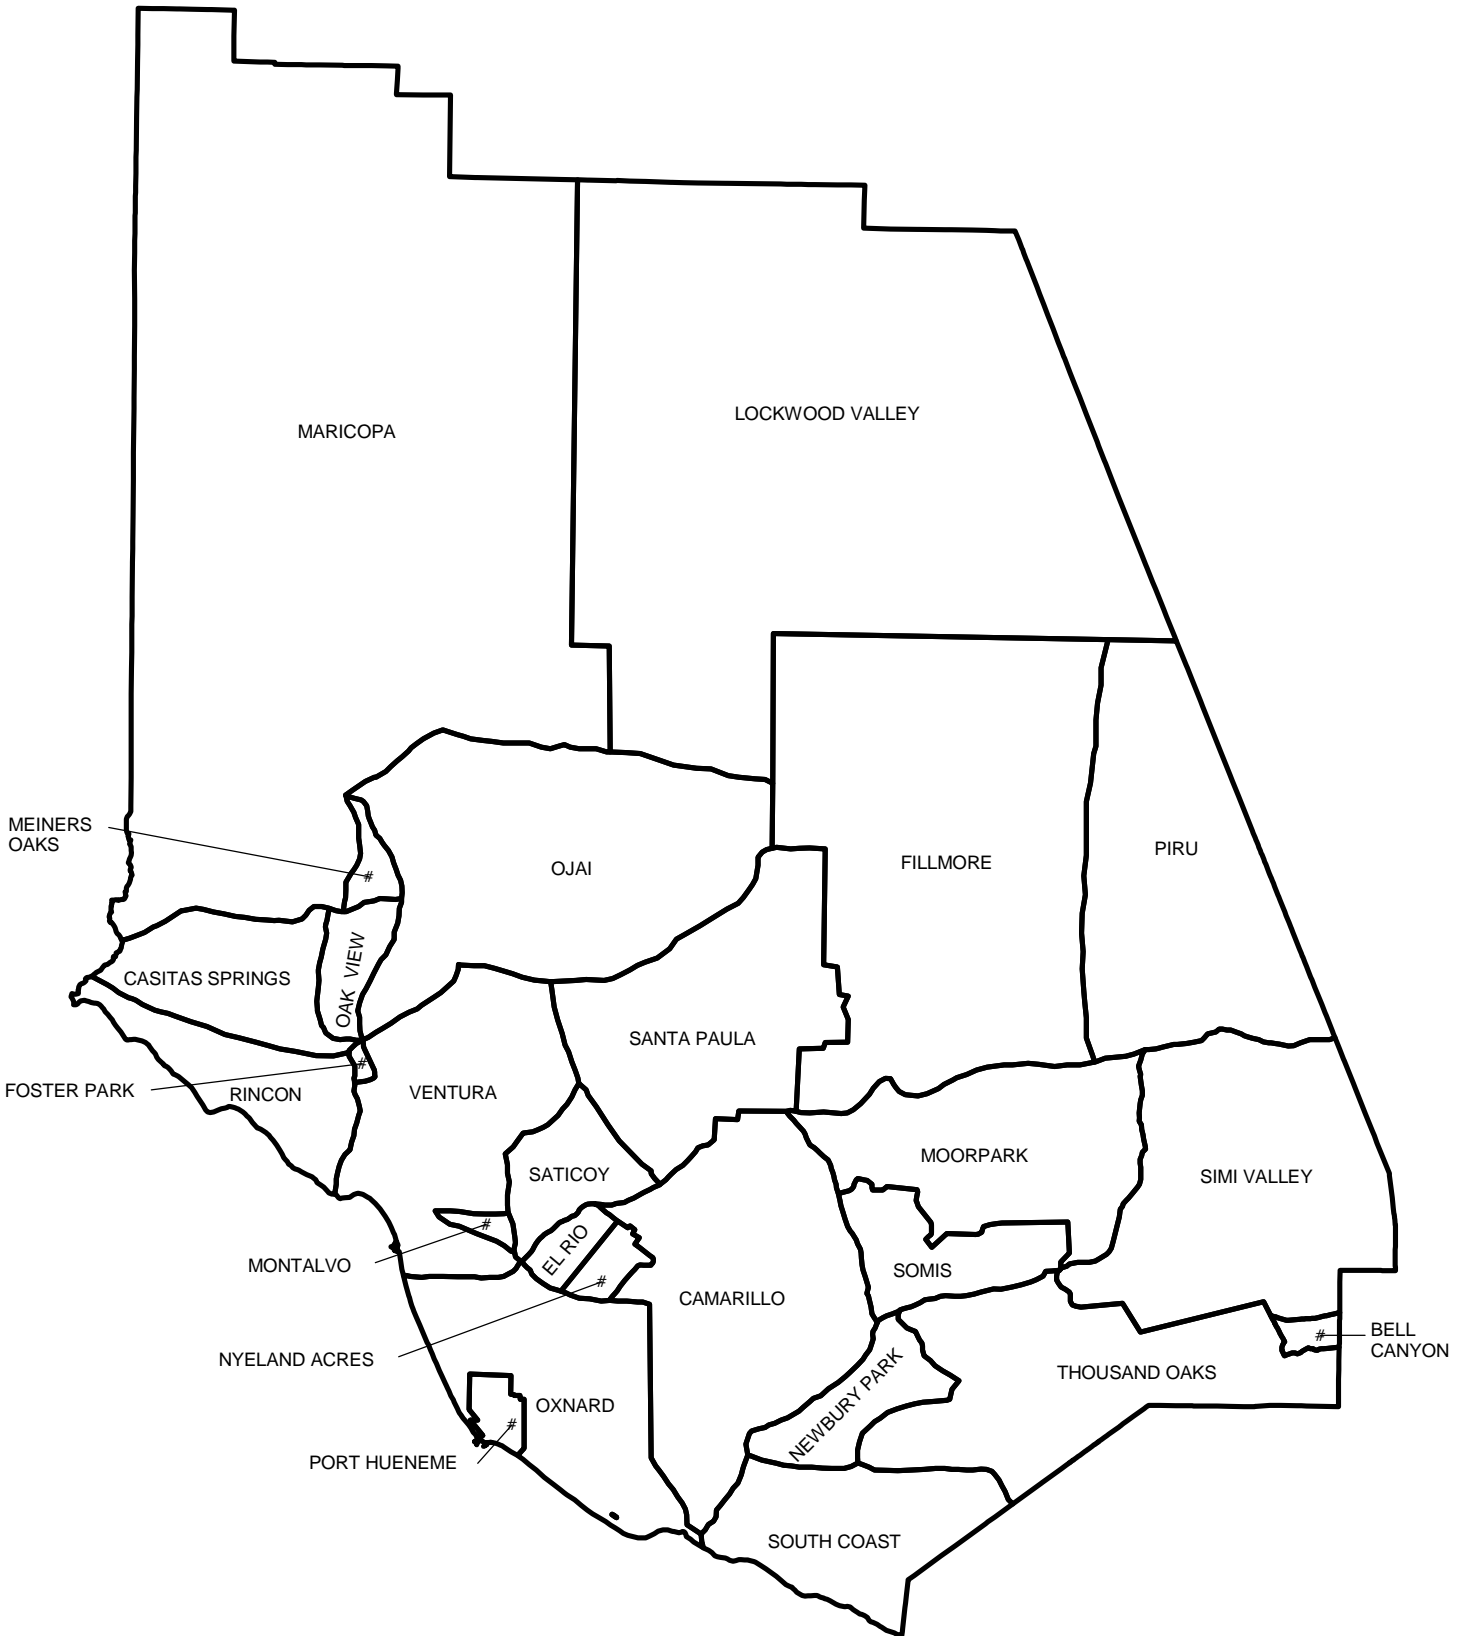

Whenever damage to underground installation creates a traffic or crowd control problem, the Police Department having jurisdiction should be notified immediately.

Miscellaneous Operations:

Upon your request and when feasible, the utility owner will negotiate an agreement for the temporary removal (cut and reconnect) of their installations to expedite your construction work. The provisions of this agreement will be dependent upon the factors involved on each job.

Normally, a minimum vertical clearance of six inches between substructures is planned. Where this condition cannot be met in the field, the owners whose substructures are affected should be notified so that a mutually agreeable installation can be arranged.
